

Here are the comprehensive, ready-to-use production prompts for Claude to completely overhaul and update your WebApp's codebase. They are structured into clean architectural boundaries so you can hand them to Claude piece by piece.

Prompt 1: Comprehensive Profile & Onboarding Questionnaire Components (#/profile)

Context: I am expanding the onboarding profile questionnaire for my Progressive Web App (gentle-badass.web.app). The app's philosophy is rooted in treating the runner as a biological organism ("The Chariot") rather than a metric-driven machine. I need you to code a clean, empathetic multi-section questionnaire components and set up its frontend state management.

Task: Build or update the Onboarding Form components with modern semantic UI (e.g., Tailwind CSS) using the exact copy and sections listed below. Ensure field states map to a single user profile object structure.

Onboarding Sections & Fields to Implement:

1. Basic Biometrics:

- Age (Number Input)
- Gender (Select: Female, Male, Prefer Not to Say)
- Height (Number Input, labeled in cm)
- Weight field labeled exactly: "Current Body Mass (for structural loading calculation)" (Number Input in kg)
- Waist field labeled exactly: "Waist Circumference (vital marker of metabolic health and core baseline)" (Number Input in inches/cm)

2. Biological Rhythms & Menstrual Cycle (Conditionally rendered ONLY if Gender is 'Female'):

- Menopausal Status (Select Dropdown: "Regular Cycles", "Perimenopausal", "Postmenopausal")
- If "Regular Cycles" or "Perimenopausal" is chosen, reveal:
 - * Average Cycle Length (Number input, default: 28 days)
 - * Date of the first day of your last period (Date Picker)
 - * Average Duration of Bleeding (Number input, default: 5 days)

3. Medical & Musculoskeletal History ("Locating Structural Leaks"):

- Joint/Muscle Pain (Multi-select Checkboxes: "Lower Back Pain", "Knee Pain", "Ankle Pain", "Plantar Fascia Issues", "None")
- Metabolic/Cardiovascular Conditions (Multi-select Checkboxes: "Hypertension", "Diabetes", "Asthma", "PCOS / PCOD", "None")

- Mental & Emotional Energy Spectrum:
 - * Slider component from 0 to 10. Label: "Where is your overall mental and emotional baseline right now?"
 - * Slider sub-labels: 0 = "Exhausted / Overwhelmed", 10 = "Grounded / Resilient"
- Open Expression text area: "Is there anything else you would like your Mentor to know about your mind or body? (Optional)"

4. Movement & Fitness History:

- Average daily movement (Select: "Under 5,000 steps / Sedentary", "5,000 - 10,000 steps / Moderately Active", "10,000+ steps / Active")
- Running History: "Have you ever run before?" (Radio Buttons: "Never", "Yes, but not in the last 6 months", "Yes, active within the last 3 months")
- Strength Training History: "Current resistance training frequency" (Select Dropdown: "0 days/week", "1-2 days/week", "3+ days/week")

Requirements:

- Ensure clean layout transitions between these sub-sections.
- Provide the fully initialized state slice and validation schemas for handling form submission.

Prompt 2: "FEEL" Daily Journal Menstrual Integration (#/journal)

Context: I need to update the daily 'FEEL' check-in module at `gentle-badass.web.app/#/journal`. For female participants who are pre- or perimenopausal, we need to collect real-time data about their menstrual phase to adapt our training prescriptions safely.

Task: Update the daily check-in journal form component to dynamically ingest the user's sex/menopausal status from their profile state, and present cycle-tracking metrics alongside the existing sleep, nutrition, and energy parameters.

Requirements:

1. Profile Ingestion Logic: Check the user profile state. If `gender === 'female'` AND `menopausalStatus`` is either "Regular Cycles" or "Perimenopausal", render an extra section within the Journal named "Cycle Sync".
2. Current Phase Flag: Use a clean button toggle or segmented control group:
 - Label: "Where are you in your cycle today?"
 - Options: "Bleeding (Active Period)", "Post-Period (High Energy Zone)", "Pre-Period (PMS / Low Energy Zone)", "N/A"
3. Subjective Symptom Sliders: Render two specialized sliders from 0 to 10:
 - Slider 1: "Cramping / Pelvic Discomfort" (0 = None, 10 = Severe)
 - Slider 2: "Cycle-Related Fatigue" (0 = Bursting with energy, 10 = Completely drained)

4. State Export: Append these values to the daily check-in record payload object under `cycleMetrics` so the adaptive algorithm can consume them.

Prompt 3: Program Adaptation Engine & Override Logic

Context: I need to build the central backend/state override function that synthesizes data from the Onboarding Profile (`#/profile`) and the daily Journal (`#/journal`) to modify the daily training instructions in the 'PLAN' module.

Task: Write a clean JavaScript/TypeScript adaptation handler engine function that processes a user's combined profile data and daily check-in scores to dynamically output the optimized, scaled text content for the daily 'Plan' (Breathe, Running, Mobility, Strength).

Incorporate the following specific medical/coaching rule sets:

1. The Low-FEEL / Recovery Override Layer:

- Calculate the average score of the day's subjective FEEL ratings (Sleep, Nutrition, Energy).
- If the average is 7 or below, intercept the scheduled running plan text. Replace intense speed or interval cues with a safe recovery alternative: "Gentle, silent 20-minute recovery walk focusing entirely on the Soft Kiss landing and slow nasal breathing."
- Inject an inline UI alert card warning: "Your internal sensors are reporting low energy today. We have adjusted your plan to keep your frame safe. Listen to your body."

2. The Menstrual Cycle Low-Intensity Modification Layer:

- If today's journal flags the phase as "Bleeding (Active Period)" OR if the calendar date lands within the projected calendar period week calculated during onboarding:
 - * Lower training intensity blocks for the running section for those active days.
 - * Swap higher velocity interval prompts to low-impact aerobic basework or base recovery walking.
- If the user logs a score of 6 or higher on "Cramping" or "Cycle-Related Fatigue":
 - * Override the heavy lower-body or core 'Strength Tools' content with a focused, low-stress recovery circuit titled: "Pelvic Alignment & Spine Mobility routine."

3. Structural Leaks Protective Buffers:

- If profile states `lowerBackPain === true`, append a mandatory high-priority instruction banner to the top of every daily Running block: "Prioritize core stability activation drills pre-run and execute the Soft Kiss silent landing test immediately on

stepping out."

- If profile states `asthma === true` or cardiorespiratory markers are flagged, overwrite the 'Breathe' instructions to strictly mandate: "Maintain strict closed-mouth nasal breathing boundaries throughout today's entire cycle. If forced to mouth-breathe, de-escalate your speed immediately."

4. Mental Health Stress Buffer:

- Check the profile's baseline mental health slider. If the initial baseline score was 4 or below ("High Stress/Low Recovery Capacity"), apply a 15% volume reductions modifier to the run interval volume metrics across weeks 1 to 3 to allow the nervous system space to stabilize.

Please output the clean functional logic layer that processes these state data parameters and maps them seamlessly onto the content string renderer of the 'Plan' component views.
