

Prompt:

Context: Currently, when a user finishes signing up and submits their onboarding profile at `loultrarunandbee.web.app`, the application displays a loading screen that explicitly states "AI is deciding your running program." This contradicts our personalized, human-centric "Mentor" philosophy. I want to completely remove any mention of AI and make the generation of the 13-week training plan feel invisible, seamless, and high-value.

Task: Update the profile submission flow, state transitions, and loading UI components to process the onboarding data completely behind the scenes.

Requirements:

1. Invisible Processing Layer:

- On clicking "Submit Profile", immediately run the background adaptation functions (the script that adjusts for body mass, menstrual cycle dates, health history, and the mental stress buffer).
- If the calculation takes under 500ms, bypass any loading state entirely and push the route directly to the user's personalized active `#!/home`` dashboard.

2. Mentor-Voiced Aesthetic Loading Component (For or network/DB delay up to 2 seconds):

- If a loading state is required by the backend save sequence, implement a clean, minimalist typography transition using Tailwind CSS fades.
- Completely remove the words "AI", "Processing", "Calculating", or "Generating".
- Instead, display a cycling sequence of elegant, organic text strings that change every 600ms:
 - * Phase 1: "Reading the baseline of your Chariot..."
 - * Phase 2: "Structuring your 13-week biological framework..."
 - * Phase 3: "Aligning your breath and movement map..."
- Maintain a soft, dark-mode friendly ambient background with zero frantic loading spinners.

3. Router & State Cleanup:

- Ensure that once the training state is initialized in the local/global state wrapper, the router cleanly replaces the history state so clicking "Back" from the Home dashboard does not re-trigger the onboarding submission form.

Please provide the optimized form submission event handler and the code for the updated transition UI view.
